1.0 Defining Project

1.1 Project Summary

a) Customer

Tech-Solution

b) Project Name

Fire Detection System

c) Team Members

- Kaw Zi Jian
- Md Fawzul Kabir Badhan
- Yusuf Athallah Adriyansyah

d) Objective

- i. To detect fire by using the computer vision technology that will alert people by early detection of fire,
- ii. To protect human lives, material assets and the environment from the danger and the effect of fire,
- iii. To detect fire with a different approach rather than using an existing system.

2.0 Planning the Project

2.1 Project Management Life Cycle

2.1.1 Work Breakdown structure

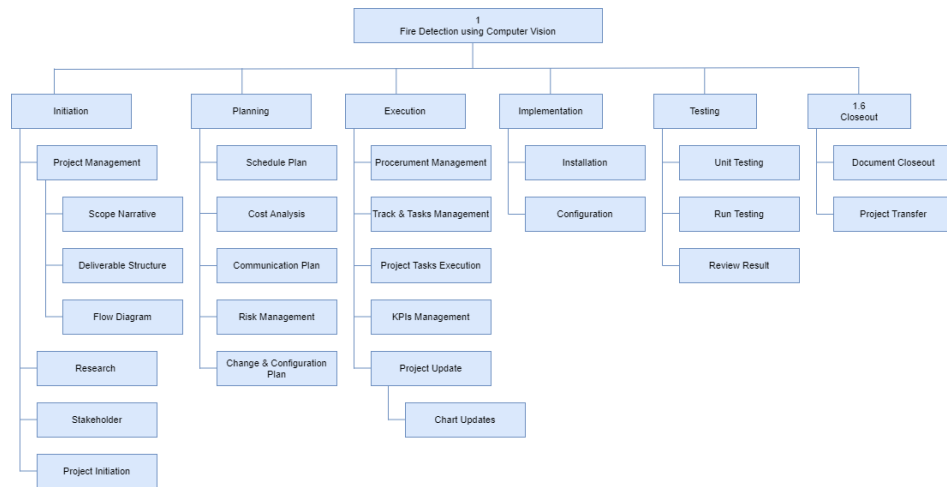

Figure 2.1.1 WBS

2.1.2 Gantt Chart

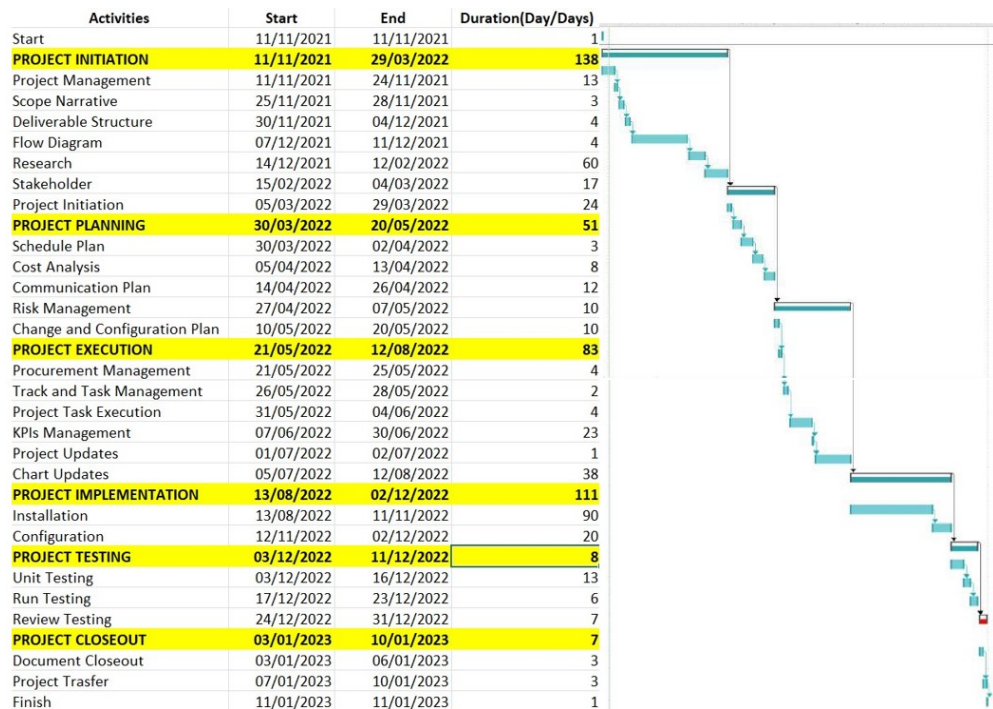

Figure 2.1.2 Gantt Chart

2.2 Risk Identification Chart

Measure of Success	Expectations	Guidelines
Time	Has been scheduled realistically and need to be delivered on time.	Stakeholders need to be alert if there are any changes of timeline.
Cost	Using lower cost materials while still making sure the quality is good.	Cost needs to be limited but if additional financial is needed, project manager has to tell the sponsor.
Quality	Need to be top notch to satisfy the customer.	Quality standards have to be followed.

2.3 Responsibility Assignment Matrices (RAM)

2.3.1 Responsibility Assignment Matrices (RAM) table

[illegible]

Figure 2.3.1 RAM Table

2.3.2 Roles and Responsibility

a) Project Manager

A project manager is someone who has the overall responsibility for initiating, planning, designing, carrying out, monitoring, controlling, and successfully closing a project.

The project manager will organise the project calendar for the stakeholders, make sure that each step is carried out, conduct budget planning and process control, and troubleshoot any issues that arise. The project manager needs to possess more general managerial abilities as well as the capacity to ask widespread questions, recognise unintentional assumptions, and settle conflicts.

b) System Designer

The system designer's job is to create a detailed blueprint and instructions that the programmers can follow. The specification of specifications that the system or business analyst has developed is the primary input document used by the system designer.

To guarantee that the system is thoroughly tested, the system designer must also create test schedules and collaborate with a group of users and system testers.

c) Programmer

A coevolutionary neural network has been used to construct an algorithm and a system, and the duty of the programmer is to define, develop, instal, and test a software framework that uses it. The software can be updated and maintained to make sure that security flaws are fixed and that it works with new databases once the final development environment has been given to the programmer.

On a computer or smartphone, programmers will create features that let users carry out basic operations, while other programmers will create the underpinning systems that manage networks.

2.4 Project Planning Summary

2.4.1 Modules/Components

Item/Service	Justification
CCTV	Needed for installation 1; we do not make this item
Configuration service	Find service company to configure the CCTV at the housing area
Installation service	Needed for transferring data to CCTV; we do not have the skill for installation.
Internet service	To do research
Google Clouds	For storage, big data, can be used for cloud AI.

5.0 Completing the Project

5.1 Acceptance / Project Completion Form

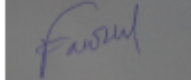

Customer Acceptance/Project Completion Form

10 January 2023

Project Name : Fire Detection System

Project Manager : Kaw Zi Jian

I (We), the undersigned, acknowledge and accept the delivery of the work completed for this project on behalf of our organisation. My (Our) signature(s) attest to my (our) agreement that this project has been completed. No further work should be done on this project.

Name	Title	Signature	Date
Md Fawzul Kabir Badhan	System Designer		10 January 2023
Yusuf Athallah Adriyansyah	Programmer		10 January 2023

1. Was this project completed to your satisfaction? Yes / No
2. Please provide the main reason of satisfaction or dissatisfaction with this project.

The key reward for finishing this project is the extraordinary strength of the quality management plan deliverable. Additionally, the project plan was amended in light of the team leader's criticism, and a training programme was developed to make this project more engaging.

3. Please provide suggestions on how our organisation could improve its project delivery capability in the future.

To increase the project delivery capability in the future, my recommendations are to communicate more effectively, work more efficiently, and achieve quick results. Additionally, with the goal of having better integration and strategic alignment, the focus is on how the initiatives are integrated throughout the organisation.

Thank you for your input.

5.2 Lesson Learnt Document

Lesson Learnt Report

10 January 2023

Project Name : Fire Detection System
Project Sponsor : Professor Burhanuddin bin Mohd Aboobaidar
Project Manager : Kaw Zi Jian
Final Budget : RM 206,251

1. Did the project meet scope, time and cost goals?

We did succeed in meeting the scope and time objectives, but we had to ask for an extra RM 15,000, which the sponsor graciously granted. By having more people than anticipated enrol in training courses, especially the online ones, we exceeded scope goals.

2. What was the success criteria listed in the project in the scope statement?

The project's scope and success criteria were outlined in the following statement: "According to our sponsor, the project will be considered a success if all of the new training courses are made available within a year, the average course evaluation score is at least 3.0 on a scale of 1 to 5, and the company recovers the project's costs through lower training costs within two years of the project's conclusion."

3. Reflect on whether you meet the project success criteria.

Within a year, all of the new training courses were made available, and they received an average rating of 3.4 out of 5.0. If the project's costs are recovered within the anticipated two years is unknown. We are convinced that the cost will be recovered in less than two years because the Web-based training is more cost-effective than the instructor-led training.

4. What were the main lessons your team learnt from this project?

The following were some of the key lessons discovered:

- Effective communication was essential to the project's success. For stakeholder communications, we had a dedicated item in the WBS, which was crucial. We made a huge transition from traditional training to largely Web-based training, so effective communication was essential.
